A free Claude Code skill for Windows 10 and 11

Gaming PC Health Check

An MOT for your gaming PC, run by Claude from inside your AIOS. It **inspects everything**, explains what it found in plain English, and **only fixes what you sign off**.

AT A GLANCE	
Areas inspected	8
Scan time	~1 min
Unapproved changes	0
Undo file	always
BIOS steps done by	you
Cost	free

What it inspects 08 areas

01 **Hardware**
Processor, graphics card, motherboard and drives: what you have and how healthy it is.

02 **BIOS**
How old yours is, what newer versions actually fix, and whether you need one at all.

03 **Memory**
Is your RAM running at the speed you paid for (XMP or EXPO), and in dual channel?

04 **Windows settings**
Game Mode, GPU scheduling, power plan, mouse acceleration, hibernation, startup apps.

05 **Graphics and screens**
Driver age, Resizable BAR, G-Sync or FreeSync, and every monitor on its native resolution and top refresh rate.

06 **Conflicts**
Two VPNs, two antivirus apps, three recorders, RGB apps fighting, "booster" apps undoing your settings.

07 **Crash history**
Hardware errors, blue screens, sudden power-offs, and which games keep crashing.

08 **Disk space**
Junk it can clear safely, plus old recordings and games you haven't played in a year.

How a check runs

1 Quick quiz
What you play, what matters most, what's bugging you.

2 Scan
About a minute. Read-only: nothing changes.

3 Report
Already right, safe fixes, needs you, your call.

4 Fixes you approve
Each one logged with an undo first.

5 BIOS cards
Step-by-step cards you follow, then it checks the result.

Ground rules it never breaks

- **Nothing changes without your yes,** and every setting it touches goes in an undo file first.
- **It never touches your BIOS.** You get a printed-style card with what normal looks like and when to stop.
- **Your games, clips and files are yours.** Nothing is deleted without asking about each one.
- **No snake oil.** No "FPS boost" registry packs, no overclocking past your memory's own factory profile.
- **Results stay on your PC,** in a dated folder with the full report.

From the first run

Built from a real tune-up of my own gaming PC.

24.5 GB	junk cleared from the Windows drive
278 GB	old recordings found and cleared, with my OK
7 → 0	devices missing drivers, Wi-Fi included
4800→5600	MT/s memory, stress-tested clean
3 → 1	VPN apps, and screen tearing fixed
Caught	Secure Boot switched off by a BIOS reset
